Propagate a Default Route in OSPFv2

Default Route Propagation

Propagate a Default Static Route in OSPFv2

To propagate a default route, the edge router must be configured with the following:

- A default static route using the **ip route 0.0.0.0 0.0.0.0 [next-hop-address | exit-intf]** command.
- The **default-information originate** router configuration command. This instructs R2 to be the source of the default route information and propagate the default static route in OSPF updates.

In the example, R2 is configured with a loopback to simulate a connection to the internet. A default route is configured and propagated to all other OSPF routers in the routing domain.

Note: When configuring static routes, best practice is to use the next-hop IP address. However, when simulating a connection to the internet, there is no next-hop IP address. Therefore, we use the **exit-intf** argument.

```
R2(config)# interface lo1
R2(config-if)# ip address 64.100.0.1 255.255.255.252
R2(config-if)# exit
R2(config)# ip route 0.0.0.0 0.0.0.0 loopback 1
%Default route without gateway, if not a point-to-point interface, may impact performance
R2(config)# router ospf 10
R2(config-router)# default-information originate
R2(config-router)# end
```

Verify the Propagated Default Route

- You can **verify the default route settings on R2** using the **show ip route** command. You can also **verify that R1 and R3 received a default route**.
- Notice that the **route source on R1** is **O*E2**, signifying that it was **learned using OSPFv2**. The **asterisk identifies this as a good candidate for the default route**. The **E2 designation identifies that it is an external route**.

```
R2# show ip route | begin Gateway
Gateway of last resort is 0.0.0.0 to network 0.0.0.0
S*      0.0.0.0/0 is directly connected, Loopback1
      10.0.0.0/8 is variably subnetted, 9 subnets, 3 masks
(output omitted)
```

```
R1# show ip route | begin Gateway
Gateway of last resort is 10.1.1.6 to network 0.0.0.0
O*E2   0.0.0.0/0 [110/1] via 10.1.1.6, 00:11:08,
GigabitEthernet0/0/0
      10.0.0.0/8 is variably subnetted, 9 subnets, 3 masks
(output omitted)
```

Packet Tracer - Propagate a Default Route in OSPFv2

In this Packet Tracer activity, you will complete the following:

- Propagate a Default Route
- Verify Connectivity

Lab 2.4 Propagate a Default Route in OSPFv2

Lab 2.4 Propagate a Default Route in OSPFv2

1. Configure a default route on R2.

Configure R2 with a directly attached default route to the internet.

```
R2(config)# ip route 0.0.0.0 0.0.0.0 Serial0/1/0
```

2. Propagate the route in OSPF.

Configure OSPF to propagate the default route in OSPF routing updates.

```
R2(config)# router ospf 1
```

```
R2(config-router)# default-information originate
```

Lab 2.4 Propagate a Default Route in OSPFv2

3. Examine the routing tables on R1 and R3.

Examine the routing tables of R1 and R3 to verify that the route has been propagated.

```

4. Verify Connectivity

Verify that PC1, PC2, and PC3 can ping the web server.

The screenshot shows a PC1 desktop environment with a taskbar at the top. The 'Desktop' tab is selected in the top navigation bar. A 'Command Prompt' window is open, displaying the results of a ping command to 64.100.1.2. The output shows four successful replies with varying round-trip times and a 0% loss rate.

4. Verify Connectivity

Verify that PC1, PC2, and PC3 can ping the web server.

The screenshot shows a Packet Tracer PC Command Line window for PC2. The window has tabs for Physical, Config, Desktop, Programming, and Attributes. The Desktop tab is active, and a Command Prompt window is open. The Command Prompt shows the following text:

4. Verify Connectivity

Verify that PC1, PC2, and PC3 can ping the web server.

The screenshot shows a Packet Tracer interface with a window titled 'PC3'. Inside the window, there are tabs for 'Physical', 'Config', 'Desktop', 'Programming', and 'Attributes'. The 'Desktop' tab is active, displaying a 'Command Prompt' window. The command prompt shows the execution of a ping command to the IP address 64.100.1.2. The output indicates that the ping was successful, with 4 packets sent, 4 received, and 0% loss. The round trip times are all 2ms.
